
The Brussels Statement on the Future Needs for Caries Epidemiology and Surveillance in Europe

Following debate and discussion prompted by a focussed, day long pre-ORCA Symposium in July 2015, the Alliance for a Cavity-Free Future Pan-European Chapter, the Platform for Better Oral Health in Europe, the European Association of Dental Public Health and the European Organisation for Caries Research (ORCA) have agreed this statement on the future needs for caries epidemiology and surveillance in Europe. Each organisation agreed to support the publication of the Statement, make it available on their Organisation's websites and strive to implement its recommendations.

EADPH recommended Preamble to the Brussels Statement:

There is:

- Strong support for the inclusion of three years olds (even if this is a non-traditional age group) and support for the examination of 18 year olds and the very elderly, wherever this is possible
- Awareness of the current age variations around previous data collected for 5 and for 6 years olds across Countries, with support for moves towards harmonisation and modelling of the impact of previous age variations
- A need to make clear to all involved the importance of respecting local professional cultures wherever possible and, ultimately, as we move to implementation the development of more clarity as to which are firm recommendations and what can be adapted locally
- Support for adoption of the various ICDAS and ICCMS™ systems, and also a desire to see the development of a range of software and paper tools to make training, implementation and use as easy as possible for all the various stakeholders
- Recognition that, in many counties, funding is a key issue for surveys and their sustainability
- Recognition that, ideally, the EU could and should play its part in both funding and promoting harmonisation in this field, improving on the perceived lack of follow-up on the two EGOHID Projects
- Awareness that socio-economic measures will have to be locally appropriate in order to be meaningful

Acknowledgements

The authors are grateful to Colgate Europe for the unrestricted grant which supported the Symposium and to the other supporters of all four organisations concerned. We would like to specifically thank all the Speakers and discussants at the pre-ORCA Symposium for their hard work and insights, as well as the participants in three parallel groups at the EADPH Meeting in Istanbul in September 2015, who debated the Statement at length and provided the agreed Preamble.

The Brussels Statement on the Future Needs for Caries Epidemiology and Surveillance in Europe

-based on the position at 2015

- Caries is still a public health problem with a high burden. This is particularly among adults and deprived and vulnerable groups across the life-course and despite improvements seen in the prevalence among some children.
- There is a need to establish *Quality Assurance* for the: sampling, training and reporting of National Surveys or Programmes. Those that meet specified criteria (to be agreed) can be “approved” by the Four Organisations for the results to be shared on a joint web-site.
- We will aim to copy the recently published Periodontology “Criteria for Reporting” document example for Caries (Holtfreter et al., 2015).
- We need to preserve (1) backward compatibility whilst (2) where needed, incorporating innovations - such as coding enamel caries.
- We acknowledge the increasing use across a number of European Countries of the epidemiological formats of ICDAS/ICCMS™ criteria for this purpose.
- We need to agree and use relevant reporting measures to more appropriately reflect the changing distribution of caries across populations.
- In that respect, sole reliance on using mean values is no longer appropriate, the median and values for quintiles should also be reported.
- The issues around health inequalities must be considered at the design stage (with the sampling of a range of socioeconomic groups), as well as in the reporting stages.
- In addition to clinical measures, the data collection systems should also include validated measures of socio-economic markers, behavioural factors and subjective measures of oral health and quality of life.
- Ideally age groups should include 3, 5, 12, 15, 18, 35-44, 65-74 as a core – but we recognise that this will have to be adapted locally, and that sample size - age groups - costs “trade-offs” need to be made in many circumstances.
- We note with interest the use of comprehensive caries registration data, opening up the possibility of longitudinal analyses. This may not be feasible in many countries, but presents a unique opportunity wherever achievable.
- We highlight the importance of developing the epidemiological surveys / surveillance programmes through dialogue / consultations with a wide range of stakeholders throughout the process.
